

Can we use immunisation data better? What matters in the Pacific?

Help us understand what is the most useful immunisation data in the Pacific

Data on immunisation programs are collected for good reasons. Collecting data on many indicators is often time-consuming. Some data are difficult to collect and report, while some may not be useful for decision-making.

Focusing on the most important indicators will reduce the burden of data collection, make it easier to organise results, and better inform immunisation program planning and decision-making.

We are asking people involved in collecting immunisation data and people who plan and make decisions about immunisation programs in the Pacific to help us.

We need your expert input to develop a customised set of indicators to measure immunisation in the Pacific.

You will be asked to participate in two online meetings to:

1. Rate indicators in an online survey
2. Discuss what data is most important and why

We will **not** be asking you to provide any immunisation coverage or other data from your country.

Location

- Online: Zoom meetings and online survey

We want to hear from you:

- Immunisation program managers
- Government decision makers
- Health information managers
- WHO or UNICEF staff supporting immunisation programs
- Immunisation experts and advisors working in the Pacific

If you'd like to speak with someone about the study, contact a member of the study team:
